

Climate change in New York City und Klimaanpassung

4

New Parks and stormwater retention - Neue Parks und Regenwasserrückhaltung

"To protect the city against future sea level rise, the governors island is being designed in such a way that half the island can flood, in a salt water resistant way. As well as 2,5 ha of floodplain on Willits Point, which can flood 1/100 years. Wetlands are being restored and protected, the wetlands restoration is being monitored to see whether it can keep up with expected sea level rise (about 3 inches/7,6cm in 2100)."
